The Effect of Household Financial, Time, and Environmental Constraints on Very Low Food Security among Children

Helen H. Jensen (PI), Iowa State University
Oleksandr Zhylyevskyy (Co-PI), Iowa State University

Research Program on Childhood Hunger
UKCPR–FNS Symposium

Alexandria, VA
June 30, 2014
Research Objectives

Main goal: to better understand circumstances of families experiencing low and very low food security among children:

1. How do food prices affect children’s food insecurity?

2. What is the importance of local food environment for children’s food insecurity?

3. Which socioeconomic and demographic characteristics exacerbate or alleviate children’s food insecurity?

4. How do household circumstances affect food preparation time?

This information contributes to improved design of food assistance programs.
Overview of Research

Conceptualize children’s food security as a “commodity” produced by households

Develop an economic model of food insecurity and food preparation time, based on household production approach (Becker, 1965; Pollak and Wachter, 1975)

Assemble a large dataset of households with children, by matching data across several national surveys

Jointly estimate equations for children’s food security status and food preparation time; test hypotheses about effects of food prices and food environment
Economic Model: Notation

- $m \geq 1$ different commodities: $Z = (z_1, ..., z_m)'$
- $z_1$: children’s food security; $\tilde{z}_1 = -z_1$: children’s food insecurity
- $l \geq 1$ different market goods: $Y = (y_1, ..., y_l)'$
- $k \geq 1$ different time use activities: $T = (t_1, ..., t_k)'$
- $t_1$: food preparation time (including time in meal preparation, food acquisition, and related travel)
- Socioeconomic and demographic characteristics $H$: household composition, income, etc.
- Location-specific attributes $L$: food prices, food establishment densities, etc.
Economic Model: Setup

Decision-maker in household $i$ maximizes utility:

$$\max_{Z_i, Y_i, T_i} U(Z_i; H_i)$$

Subject to:

Production technology constraint: $F(Z_i, Y_i, T_i; H_i, L_i) = 0$

Time constraint: $Q(T_i; H_i) = 0$

Budget constraint: $B(Y_i, T_i; H_i, L_i) = 0$

Non-negativity constraints: $Z_i, Y_i, T_i \geq 0$

Equations for children’s food insecurity and food preparation time come from the problem solution:

$$\tilde{z}_{1,i} = \tilde{z}_1(H_i, L_i)$$
$$t_{1,i} = t_1(H_i, L_i)$$
Data

• Households with children, pooled across multiple years:
  • Food Security Supplement (FSS) of CPS, 2002–2010
  • American Time Use Survey (ATUS), 2003–2011
  • Matched analytical sample: \( N = 13,474 \) households/respondents

• Food prices and location-specific data:
  • Quarterly Food-at-Home Price Database (QFAHPD, source: ERS)
  • ACCRA database (source: Council for Community and Economic Research)
  • County Business Patterns data (CBP, source: Census Bureau)
  • Small Area Income and Poverty Estimates (SAIPE) program database, American FactFinder database (source: Census Bureau)
Data Processing

CPS–FSS raw data files, 2002–2010

Data processing:
- Drop incomplete CPS/missing FSS cases
- Drop cases without children
- Drop cases in first 4 months in CPS
- Drop 8th-month CPS rotation in FSS 2007

FSS sample, 2002–2010
\( N = 68,381 \) (households)
- 5,600-8,600 observations/year

ATUS raw data files, 2003–2011

Data processing of linked records:
- Drop cases without ATUS interview
- Drop designated low quality data
- Retain householder/spouse/partner records

ATUS–FSS analytical sample, 2002–2011
\( N = 13,474 \) (merged households/respondents)
- 1,100–2,300 observations per year

Food Prices and Other Location-Specific Data: QFAHPD, ACCRA, CBP, SAIPE

Merged final analytical dataset, 2002–2011: \( N = 13,474 \)
Dependent Variables

**Food security status** is determined via responses by adult proxy to 8 child-specific questions in 18-item Household Food Security Survey Module in FSS:

- *Four* ordered categories of children’s food security
- Referenced to last 12 months

**Food preparation time** includes time in seven ATUS activities, measured in minutes on the reference day:

1. Food and drink preparation
2. Food presentation
3. Kitchen and food clean-up
4. Food and drink preparation, presentation, and clean-up, n.e.c.
5. Grocery shopping
6. Travel related to food & drink preparation/clean-up/presentation
7. Travel related to grocery shopping
## Selected Descriptive Statistics

### Distribution of households by children’s food security status:

<table>
<thead>
<tr>
<th>Food Security Category</th>

<td>56.15</td>
</tr>
<tr>
<td>Women</td>
<td>18.33%</td>
<td>90.26</td>
</tr>
</tbody>
</table>
Food Price Indices

**Food-at-home price index:**
- Based on food price data in QFAHPD (real $ per 100 grams of food as purchased)
- Expenditure-weighted average of 50+ food group prices
- Location- and time-specific: by market area and quarter
- Merged with sample records using a procedure of Gregory and Coleman-Jensen (2013)

**Fast food price index:**
- Based on three individual food item prices in ACCRA database
- Same as fast food price index of Chou et al. (2004), Powell (2009)
- Location- and time-specific: by metropolitan area and quarter
- Merged with sample records by CBSA and state FIPS codes
Food Establishment Densities

Main source: County Business Patterns (CBP) database

Businesses are classified using 6-digit NAICS code

We create densities—number of establishments per 10,000 residents—for five groups of establishments:

- **Supermarkets** and other general line grocery stores
- **Convenience stores**
- **Specialty food stores**
  - Meat markets; fish and seafood markets; fruit and vegetable markets; baked goods stores; confectionery and nut stores; all other specialty food stores; retail bakeries
- **Full-service restaurants**
- **Limited-service eating places**
Empirical Model

Data on food insecurity are ordered categorical ⇒ adopt ordered probit approach. Latent variable:

$$\tilde{z}_{1,i}^* = X_i^Z' \cdot \beta + \epsilon_i$$

Observed food insecurity:

$$\tilde{z}_{1,i} = k \text{ if and only if } \mu_k < \tilde{z}_{1,i}^* \leq \mu_{k+1}$$

Data on food preparation time contain many zeroes ⇒ adopt Tobit approach. Latent variable:

$$t_{1,i}^* = X_i^T' \cdot \gamma + \eta_i$$

Observed food preparation time:

$$t_{1,i} = 0 \text{ if } t_{1,i}^* \leq 0; \quad t_{1,i} = t_{1,i}^* \text{ if } t_{1,i}^* > 0$$

$X_i^Z$ and $X_i^T$ are explanatory variables based on $H_i$ and $L_i$
Estimation Approach

Error terms might be correlated; we specify:
\[(\epsilon_i) | X_i \sim N \left( \left( \begin{array}{c} 0 \\ 0 \end{array} \right), \left( \begin{array}{cc} \rho \sigma & \rho \sigma \\ \rho \sigma & \sigma^2 \end{array} \right) \right) \]

Food insecurity and food preparation time equations are estimated **jointly**, by using maximum likelihood method:
\[
\hat{\theta}_{MLE} = \arg \max_{\theta} \sum_{i=1}^{n} \ln L_i(\theta)
\]
\(\theta\): parameter vector, \(L_i(\theta)\): likelihood contribution

After estimation, we compute **average marginal effects** (AMEs):
\[
AME(\tilde{z}_1 = k) = \frac{1}{n} \sum_{i=1}^{n} \frac{\partial}{\partial X_i} \Pr[\tilde{z}_{1,i} = k | X_i; \hat{\theta}_{MLE}]
\]
\[
AME(t_1) = \frac{1}{n} \sum_{i=1}^{n} \frac{\partial}{\partial X_i} \mathbb{E}[t_{1,i} | X_i; \hat{\theta}_{MLE}]
\]

Average food preparation time: 52.06 min/day
Summary and Policy Implications

• Research examines children’s food security within a household production framework to test hypotheses about effects of socio-demographic factors, financial resources and local food environment on:
  • Food insecurity
  • Time in food preparation

• Findings support hypothesized effects and have implications for policy approaches and further research on causal effects:
  • Financial resources matter: increases in income and income above 185% poverty are associated with less food insecurity
  • Food prices and food environment (convenience and specialty food stores) matter: more available and lower priced local food (fast food) is associated with less food insecurity
  • Food preparation time: household structure, low-income status, day-of-the-week, and season explain differences in time use
Thank you!

Questions?
Details on Likelihood Contribution

When $t_{1,i} = 0$, the likelihood contribution is:

$$L_i(\theta) = \int_{\mu_{z_{1,i}+1} - x_i^t \beta}^{\mu_{z_{1,i}} - x_i^t \beta} \int \int f(\epsilon, \eta) d\eta d\epsilon$$

When $t_{1,i} > 0$, the likelihood contribution is:

$$L_i(\theta) = f(\eta(t_{1,i} - X_i^t \gamma)) \cdot \int_{\mu_{z_{1,i}+1} - x_i^t \beta}^{\mu_{z_{1,i}} - x_i^t \beta} \int f(\epsilon|t_{1,i} - X_i^t \gamma)(\epsilon) d\epsilon$$
Details on Food Insecurity Measure

Children’s food security status is determined via responses by adult proxy to 8 child-specific questions in 18-item Household Food Security Survey Module in FSS.

Four ordered categories of children’s food security:
1. High/marginal: raw score of 0
2. Marginal: raw score of 1
3. Low: raw score of 2–4
4. Very low: raw score of 5–8

We focus on HFSSM items referenced to last 12 months.
Details on Time in Food Preparation

Kernel Densities of Time in Food Preparation (Conditional on Time > 0)
Details on Research Hypotheses

• Group A: effects of food prices on food insecurity
  • Higher prices of food at home and fast food ⇒ more food insecurity among children

• Group B: effects of food environment on food insecurity
  • Higher density of supermarkets/other food stores, and higher density of full-service restaurants and limited-service eating places ⇒ less food insecurity among children

• Group C: effects of socioeconomic characteristics on food insecurity
  • More income ⇒ less food insecurity
  • Higher educational attainment ⇒ less food insecurity
  • More children in household ⇒ more food insecurity

• Group D: effects of household circumstances on time in food preparation
  • Men spend less time in food preparation than women
  • Householders in single-headed households spend less time than married women
  • More children in household ⇒ more time in food preparation
  • More income, more education ⇒ less time in food preparation
  • Amount of time in food preparation varies with day-of-the-week, season
Motivation

Incidence of food insecurity is substantial among low-income households with children (~43% when income < 130% of FPL)

Food insecurity is linked to poor health, depression, other negative outcomes in physical, intellectual, and social development of children

Food preparation decisions influence nutritional content of foods consumed and can affect health outcomes among children

Better understanding of effects of food prices, food environment, other factors on food insecurity among children and of food preparation time can inform public policy and design of food assistance programs
